Problem 1. Solve the IVP:

$$y' = y^2 \cos(x), \quad y(0) = 2.$$

Solution. Note that this is a separable differential equation and after separating we see that

$$\frac{dy}{y^2} = \cos(x)dx$$

$$\int \frac{dy}{y^2} = \int \cos(x)dx$$

$$-\frac{1}{y} = \sin(x) + c_1$$

so that

$$y = -\frac{1}{\sin(x) + c_1}$$

is the general solution to the differential equation. Using the initial value y(0) = 2 and solving for c_1 we see that $c_1 = -1/2$ and the solution to the IVP is given by

$$y = -\frac{1}{\sin(x) - 1/2}.$$

Problem 2. Review solutions of first-order linear ODEs (p. 14) and solve the IVP:

$$y' - xy = x^3$$
, $y(1) = \frac{1}{2}$.

Solution. The solution to the first-order linear ODE

$$y'(x) + p_0(x)y(x) = f(x)$$

is given by

$$y(x) = \frac{c_1}{I(x)} + \frac{1}{I(x)} \int_0^x f(t)I(t)dt, \quad I(x) = \exp\left(\int_0^x p_0(t)dt\right).$$

For this problem, we set $p_0(x) = -x$ and $f(x) = x^3$ and see that

$$I(x) = \exp\left(\int_0^x p_0(t)dt\right) = \exp\left(\int_0^x -tdt\right) = \exp\left(-\frac{x^2}{2}\right).$$

Thus the general solution to the ODE $y' - xy = x^3$ is given by

$$y = \frac{c_1}{\exp\left(-\frac{x^2}{2}\right)} + \frac{1}{\exp\left(-\frac{x^2}{2}\right)} \int_0^x t^3 \exp\left(-\frac{t^2}{2}\right) dt$$
$$= \frac{c_1}{\exp\left(-\frac{x^2}{2}\right)} - \frac{\exp\left(-\frac{x^2}{2}\right)}{\exp\left(-\frac{x^2}{2}\right)} (2 + x^2)$$
$$= \frac{c_1}{\exp\left(-\frac{x^2}{2}\right)} - (2 + x^2)$$

Using the initial value $y(1) = \frac{1}{2}$, we see that $c_1 = \frac{7}{2} \exp\left(-\frac{1}{2}\right)$ and the solution to the IVP is

$$y = \frac{7\exp\left(-\frac{1}{2}\right)}{2\exp\left(-\frac{x^2}{2}\right)} - (2+x^2).$$

Problem 3. Let $Ly = y^{(4)} - 4y''' + 3y'' + 4y' - 4y$.

- a. Find the general solutions of the homogeneous ODE Ly = 0.
- b. Solve the IVP:

$$Ly = 0$$
, $y(0) = 0$, $y'(0) = -7$, $y''(0) = 5$, $y'''(0) = 9$.

c. Solve the BVP:

$$Ly = 0$$
, $y(0) = 1$, $\lim_{x \to \infty} y(x) = 0$.

Is this BVP well-posed?

d. Solve the BVP:

$$Ly = 0, \quad y(0) = 1, \quad \lim_{x \to -\infty} y(x) = 0.$$

Is this BVP well-posed?

Solution. a. The characteristic equation associated to the homogeneous ODE Ly = 0 is $m(x) = x^4 - 4x^3 + 3x^2 + 4x - 4$. The roots of the characteristic polynomial are $r_1 = -1$, $r_2 = 1$, $r_3 = 2$, and $r_4 = 2$.

Therefore, the general solution of the homogeneous ODE is

$$y(x) = c_1 e^{-x} + c_2 e^x + c_3 e^{2x} + c_4 x e^{2x}.$$
 (1)

b. Through an abuse of notation, we note that the matrix associated to the Wronskian of this equation as function of x is given by

$$W(x) = \begin{bmatrix} e^{-x} & e^x & e^{2x} & xe^{2x} \\ -e^{-x} & e^x & 2e^{2x} & e^{2x} + 2xe^{2x} \\ e^{-x} & e^x & 4e^{2x} & 4e^{2x} + 4xe^{2x} \\ -e^{-x} & e^x & 8e^{2x} & 12e^{2x} + 8xe^{2x} \end{bmatrix}.$$

The solution to the IVP is determined by particular values of the coefficients in the general solution (1). These coefficients are found as the solution to the system of equations $W(0)\mathbf{c} = \mathbf{b}$ where

$$\boldsymbol{c} = \begin{bmatrix} c_1 \\ c_2 \\ c_3 \\ c_4 \end{bmatrix}$$
 and $\boldsymbol{b} = \begin{bmatrix} 0 \\ -7 \\ 5 \\ 9 \end{bmatrix}$.

The solution to this system is given by $c = \langle 4, -3, -1, 2 \rangle$. Therefore, the solution to the IVP is

$$y(x) = 4e^{-x} - 3e^x - e^{2x} + 2xe^{2x}$$

c.

d.

Problem 4. Read $\S 1.6$ and then solve the ODEs:

$$xy' + 2y = x^2\sqrt{y}$$
, $y' = \frac{4x^3 - 6xy^2 - 2xy}{x^2 + 6x^2y - 3y^2}$, $y' + y^2 + (2x + 1)y + 1 + x + x^2 = 0$.

 \Box

Problem 5. a. Use mathematical induction to prove Leibnitz's differentiation rule:

$$D^{k}(fg) = \sum_{j=0}^{k} {k \choose j} (D^{j}f)(D^{k-j}g).$$

Here f = f(x) and g = g(x) are k-times differentiable functions and $D^k = \frac{d^k}{dx^k}$.

b. Consider the constant-coefficient ODE

$$D^{n}y + p_{n-1}D^{n-1}y + \dots + p_{1}Dy + p_{0}y = 0,$$
(2)

where $p_0, p_1, \ldots, p_{n-1}$ are real numbers. Let r be a double root of the characteristic polynomial $P(z) = z^n + p_{n-1}z^{n-1} + \cdots + p_1z + p_0$. Use Leibnitz's rule to show that the function xe^{rx} is a solution of (2).

- c. Let r be a triple root of the characteristic polynomial P(z) from part (b). Use Leibnitz's rule to show that the function x^2e^{rx} is then also a solution of (2).
- d. Let r be a real number. Show that the functions e^{rx} , xe^{rx} , and x^2e^{rx} are linearly independent on \mathbb{R} .

 \square

Problem 6. Use the formula for the derivative of a determinant from the l	lectures, other
properties of determinants, and the linear ODE $(1.3.1)$ to verify identity $(1.3.1)$	4) in the text-
book.	
Solution.
