Homework Assignment 9

Matthew Tiger

May 7, 2017

Problem 8.1. Find the Mellin transform of each of the following functions:

   a. $f(x) = H(a - x)$, $a > 0$,

   b. $f(x) = x^m e^{-nx}$, $m, n > 0$,

   c. $f(x) = \dfrac{1}{x^2 + 1}$.

Solution. The Mellin transform of the function $f(x)$ is defined to be

$$\mathscr{M}\{f(x)\} = \tilde{f}(p) = \int_0^\infty x^{p-1} f(x) dx.$$

   a. Recall that the Heaviside function H is defined as

$$H(a - x) = \begin{cases} 1 & \text{if } x < a \\ 0 & \text{if } x > a \end{cases}.$$

Therefore, from the definition of the Mellin transform, we have that for $f(x) = H(a-x)$ with $a > 0$,

$$
\begin{aligned}
\tilde{f}(p) = \mathscr{M}\{f(x)\} &= \int_0^\infty x^{p-1} H(a - x) dx \\
&= \int_0^a x^{p-1} dx \\
&= \frac{a^p}{p}.
\end{aligned}
$$

   b. Let $f(x) = x^m g(x)$ where $g(x) = e^{-nx}$ with $m, n > 0$ and let $\tilde{g}(p) = \mathscr{M}\{g(x)\}$.

By the shifting property of the Mellin transform, we have that

$$\tilde{f}(p) = \mathscr{M}\{f(x)\} = \mathscr{M}\{x^m g(x)\} = \tilde{g}(p + m).$$

From our table of Mellin transforms, we know that

$$\tilde{g}(p) = \mathscr{M}\{g(x)\} = \frac{\Gamma(p)}{n^p}$$

where $\Re\{p\} > 0$.

Therefore,

$$\tilde{f}(p) = \mathscr{M}\{f(x)\} = \tilde{g}(p+m) = \frac{\Gamma(p+m)}{n^{p+m}}$$

where $\Re\{p+m\} > 0$.

c. From our table of Mellin transforms, we see that

$$\mathscr{M}\left\{\frac{1}{(x^a+1)^s}\right\} = \frac{\Gamma(p/a)\Gamma(s-p/a)}{a\Gamma(s)}.$$

Therefore, for $f(x) = \frac{1}{x^2+1}$, identifying $a = 2$ and $s = 1$, we have that

$$\tilde{f}(p) = \mathscr{M}\{f(x)\} = \mathscr{M}\left\{\frac{1}{x^2+1}\right\} = \frac{\Gamma(p/2)\Gamma(1-p/2)}{2\Gamma(1)}$$
$$= \frac{\Gamma(p/2)\Gamma(1-p/2)}{2}$$

where $\Re\{p/2\} > 0$ and $\Re\{1-p/2\} > 0$.

$\square$

Problem 8.4. Show that

$$\mathscr{M}\left\{\frac{1}{(1+ax)^n}\right\} = \frac{\Gamma(p)\Gamma(n-p)}{a^p\Gamma(n)}.$$

Solution. Let $f(x) = \dfrac{1}{(1+x)^n}$ where $n > 0$. Recall that the Beta function

$$B(x,y) = \int_0^1 t^{x-1}(1-t)^{y-1}dt$$

satisfies the property that

$$B(x,y) = \frac{\Gamma(x)\Gamma(y)}{\Gamma(x+y)}.$$

From the definition of the Gamma function, we see that

$$B(x,y) = \frac{\Gamma(x)\Gamma(y)}{\Gamma(x+y)} = \int_0^\infty \frac{t^{x-1}}{(1+t)^{x+y}}dt.$$

Thus, we have from the definition of the Mellin transform that

$$\begin{aligned}
\mathscr{M}\left\{f(x)\right\} &= \int_0^\infty \frac{x^{p-1}}{(1+x)^n}dx \\
&= \int_0^\infty \frac{x^{p-1}}{(1+x)^{n-p+p}}dx \\
&= \frac{\Gamma(p)\Gamma(n-p)}{\Gamma(n)}.
\end{aligned}$$

Therefore, by the scaling property of the Mellin transform,

$$\begin{aligned}
\mathscr{M}\left\{\frac{1}{(1+ax)^n}\right\} = \mathscr{M}\left\{f(ax)\right\} &= \frac{\mathscr{M}\left\{f(x)\right\}}{a^p} \\
&= \frac{\Gamma(p)\Gamma(n-p)}{a^p\Gamma(n)}.
\end{aligned}$$

$\square$

Problem 8.10. Show that the integral equation

$$f(x) = h(x) + \int_0^\infty f(\xi)g\left(\frac{x}{\xi}\right)\frac{d\xi}{\xi}$$

has the formal solution

$$f(x) = \frac{1}{2\pi i}\int_{c-i\infty}^{c+i\infty}\frac{x^{-p}\tilde{h}(p)}{1-\tilde{g}(p)}dp.$$

Solution. Define the convolution of the functions $f(x)$ and $g(x)$ as

$$(f * g)(x) = \int_0^\infty f(\xi)g\left(\frac{x}{\xi}\right)\frac{d\xi}{\xi}.$$

Then the integral equation becomes

$$f(x) = h(x) + (f * g)(x)$$

Now, let $\tilde{f}(p), \tilde{g}(p)$, and $\tilde{h}(p)$ denote the Mellin transforms of $f(x), g(x)$, and $h(x)$, respectively. Taking the Mellin transform of the integral equation shows that

$$\begin{aligned}\tilde{f}(p) &= \mathscr{M}\left\{h(x) + (f * g)(x)\right\}\\ &= \tilde{h}(p) + \mathscr{M}\left\{(f * g)(x)\right\}\\ &= \tilde{h}(p) + \tilde{f}(p)\tilde{g}(p)\end{aligned}$$

where we have used the Convolution Type Theorem which states that

$$\mathscr{M}\left\{(f * g)(x)\right\} = \tilde{f}(p)\tilde{g}(p).$$

Thus, after taking the Mellin transform, the integral equation becomes an algebraic one in the variable p. Solving for $\tilde{f}(p)$ shows that

$$\tilde{f}(p) = \frac{\tilde{h}(p)}{1-\tilde{g}(p)}.$$

Therefore, the formal solution to the integral equation is

$$f(x) = \mathscr{M}^{-1}\left\{\tilde{f}(p)\right\} = \frac{1}{2\pi i}\int_{c-i\infty}^{c+i\infty}\frac{x^{-p}\tilde{h}(p)}{1-\tilde{g}(p)}dp.$$

$\square$

Problem 8.12. Assuming that

$$\mathcal{M}\left\{f\left(re^{i\theta}\right)\right\} = \int_0^\infty r^{p-1} f\left(re^{i\theta}\right) dr$$

where p is real. Putting $\xi = re^{i\theta}$ and $\mathcal{M}\left\{f(\xi)\right\} = F(p)$, show that

   a. $\mathcal{M}\left\{f(re^{i\theta})\right\} = e^{-ip\theta} F(p)$.

Hence, deduce

   b. $\mathcal{M}^{-1}\left\{F(p)\cos p\theta\right\} = \Re\{f(re^{i\theta})\}$,

   c. $\mathcal{M}^{-1}\left\{F(p)\sin p\theta\right\} = -\Im\{f(re^{i\theta})\}$.

Solution.   a. If $\xi = re^{i\theta}$, then $r = \xi e^{-i\theta}$ and $dr = e^{-i\theta} d\xi$. Now, from our assumption, we see that

$$\begin{aligned}
\mathcal{M}\left\{f\left(re^{i\theta}\right)\right\} &= \int_0^\infty r^{p-1} f\left(re^{i\theta}\right) dr \\
&= \int_0^\infty \left(\xi e^{-i\theta}\right)^{p-1} f\left(\xi\right) e^{-i\theta} d\xi \\
&= e^{-ip\theta} \int_0^\infty \xi^{p-1} f\left(\xi\right) d\xi \\
&= e^{-ip\theta} F(p),
\end{aligned}$$

    as desired.

   b. As shown above, we have that

$$\mathcal{M}\left\{f(re^{i\theta})\right\} = e^{-ip\theta} F(p).$$

    From the definition of the complex exponential, this implies that

$$\mathcal{M}\left\{f(re^{i\theta})\right\} = e^{-ip\theta} F(p) = F(p)\cos p\theta - iF(p)\sin p\theta.$$

    Thus, applying the inverse Mellin transform, we see that

$$f(re^{i\theta}) = \mathcal{M}^{-1}\left\{F(p)\cos p\theta\right\} - i\mathcal{M}^{-1}\left\{F(p)\sin p\theta\right\}. \tag{1}$$

    Therefore, we have that

$$\mathcal{M}^{-1}\left\{F(p)\cos p\theta\right\} = \Re\{f(re^{i\theta})\}.$$

   c. Similarly, from (1), we have that

$$\mathcal{M}^{-1}\left\{F(p)\sin p\theta\right\} = -\Im\{f(re^{i\theta})\}.$$

$\square$

Problem 8.14. Use $\mathscr{M}^{-1}\left\{\dfrac{\pi}{\sin p\pi}\right\} = \dfrac{1}{1+x} = f(x)$ and exercise 8.12 to show that

a. $\mathscr{M}^{-1}\left\{\dfrac{\pi\cos p\theta}{\sin p\pi}\right\} = \dfrac{1+r\cos\theta}{1+2r\cos\theta+r^2}$,

b. $\mathscr{M}^{-1}\left\{\dfrac{\pi\sin p\theta}{\sin p\pi}\right\} = \dfrac{r\sin\theta}{1+2r\cos\theta+r^2}$.

Solution. Suppose that $F(p) = \dfrac{\pi}{\sin p\pi}$. Then from our assumption, we have that

$$\mathscr{M}\{f(x)\} = \mathscr{M}\left\{\frac{1}{1+x}\right\} = \frac{\pi}{\sin p\pi} = F(p).$$

Now suppose that $x = re^{i\theta}$. Then, from the complex exponential and other properties of complex numbers and trigonometric functions, we have that

$$f(re^{i\theta}) = \frac{1}{1+re^{i\theta}} = \frac{1}{1+r\cos\theta+ir\sin\theta}\left[\frac{1+r\cos\theta-ir\sin\theta}{1+r\cos\theta-ir\sin\theta}\right]$$

$$= \left[\frac{1+r\cos\theta}{(1+r\cos\theta)^2+r^2\sin^2\theta}\right] - i\left[\frac{r\sin\theta}{(1+r\cos\theta)^2+r^2\sin^2\theta}\right]$$

$$= \left[\frac{1+r\cos\theta}{1+2r\cos\theta+r^2}\right] - i\left[\frac{r\sin\theta}{1+2r\cos\theta+r^2}\right]$$

Thus, we have that

$$\Re\{f(re^{i\theta})\} = \frac{1+r\cos\theta}{1+2r\cos\theta+r^2} \tag{2a}$$

$$\Re\{f(re^{i\theta})\} = -\frac{r\sin\theta}{1+2r\cos\theta+r^2} \tag{2b}$$

a. Therefore, we have from (2a) and exercise 8.12.b that

$$\mathscr{M}^{-1}\left\{\frac{\pi\cos p\theta}{\sin p\pi}\right\} = \mathscr{M}^{-1}\{F(p)\cos p\theta\} = \Re\{f(re^{i\theta})\} = \frac{1+r\cos\theta}{1+2r\cos\theta+r^2}.$$

b. Similarly, we see from (2b) and exercise 8.12.c that

$$\mathscr{M}^{-1}\left\{\frac{\pi\sin p\theta}{\sin p\pi}\right\} = \mathscr{M}^{-1}\{F(p)\sin p\theta\} = -\Im\{f(re^{i\theta})\} = \frac{r\sin\theta}{1+2r\cos\theta+r^2}.$$

$\square$

Problem 8.21. Show that the solution of the boundary value problem

$$r^2\phi_{rr} + r\phi_r + \phi_{\theta\theta} = 0, \qquad 0 < r < \infty, \quad 0 < \theta < \pi$$
$$\phi(r,0) = \phi(r,\pi) = f(r)$$

is

$$\phi(r,\theta) = \frac{1}{2\pi i}\int_{c-i\infty}^{c+i\infty} r^{-p}\frac{\tilde{f}(p)\cos\left[p(\theta - \pi/2)\right]}{\cos\left[\pi p/2\right]}dp$$

Solution. Recall that if $\tilde{f}(p) = \mathscr{M}\{f(x)\}$, then the Mellin transform has the following property

$$\mathscr{M}\left\{x^n f^{(n)}(x)\right\} = (-1)^n\frac{\Gamma(p+n)}{\Gamma(p)}\tilde{f}(p). \tag{3}$$

Thus, from (3), applying the Mellin transform with respect to r to the boundary value problem yields

$$p(p+1)\tilde{\phi}(p,\theta) - p\tilde{\phi}(p,\theta) + \frac{d^2}{d\theta^2}\left[\tilde{\phi}(p,\theta)\right] = 0, \qquad 0 < p < \infty, \quad 0 < \theta < \pi.$$

or, equivalently,

$$\frac{d^2}{d\theta^2}\left[\tilde{\phi}(p,\theta)\right] + p^2\tilde{\phi}(p,\theta) = 0, \qquad 0 < p < \infty, \quad 0 < \theta < \pi.$$

The solution to the above homogeneous linear ordinary differential equation is

$$\tilde{\phi}(p,\theta) = c_1(p)\cos p\theta + c_2(p)\sin p\theta. \tag{4}$$

Applying the Mellin transform to the boundary conditions yields that

$$\tilde{\phi}(p,0) = \tilde{\phi}(p,\pi) = \tilde{f}(p).$$

Using these transformed boundary conditions in conjunction with (4) gives us the following system of equations

$$c_1(p) = \tilde{f}(p)$$
$$c_1(p)\cos p\pi + c_2(p)\sin p\pi = \tilde{f}(p).$$

We readily see that the solution to this system is

$$c_1(p) = \tilde{f}(p)$$
$$c_2(p) = \frac{\tilde{f}(p)(1 - \cos p\pi)}{\sin p\pi}.$$

Thus, the solution to the transformed boundary value problem is

$$\tilde{\phi}(p, \theta) = \tilde{f}(p) \cos p\theta + \frac{\tilde{f}(p)(1 - \cos p\pi)}{\sin p\pi} \sin p\theta$$

$$= \tilde{f}(p) \left(\cos p\theta + \sin p\theta \tan p\pi/2 \right)$$

$$= \frac{\tilde{f}(p) \cos \left[p(\theta - \pi/2) \right]}{\cos \left[\pi p/2 \right]}.$$

Therefore, the solution to the original boundary value problem is

$$\phi(r, \theta) = \mathscr{M}^{-1} \left\{ \tilde{\phi}(p, \theta) \right\} = \mathscr{M}^{-1} \left\{ \frac{\tilde{f}(p) \cos \left[p(\theta - \pi/2) \right]}{\cos \left[\pi p/2 \right]} \right\}$$

$$= \frac{1}{2\pi i} \int_{c-i\infty}^{c+i\infty} r^{-p} \frac{\tilde{f}(p) \cos \left[p(\theta - \pi/2) \right]}{\cos \left[\pi p/2 \right]} dp.$$

$\square$
